What's New in the?

4Media MP4 to MP3 Converter is a software that allows you to encode media files of various types (including MP4, RM, OGG, 3GP, AVI and MOV) into the MP3 format. The interface of the program is clean and intuitive. All you have to do is choose the profile (although the MP3 profile is the only option), add files to the queue (batch conversion and the "drag and drop" function are supported) and initiate the encoding process. In addition, you can specify the output destination, preview the song or video, configure settings, view and select CPU cores, and configure settings. Thus, you can select the audio quality, channels, stream, codec, sample frequency rate and bitrate, as well as input lyrics. You can also write metadata (e.g. title, author, copyright, album) and enable ID3v2 tags. Furthermore, you can rip an audio CD, clear the task list, customize the appearance, set the action after a conversion completes (e.g. shutdown computer, exit program), configure general preferences (e.g. automatically check for updates), and more. The program uses a high amount of system resources when it's busy with a task, contains a well-drawn help file and is able to finish a job in a reasonable amount of time. However, it failed to convert certain files (AVI, MPEG) and froze while attempting to encode a RM and RMVB file. Also, you cannot configure the video stream (the option exists but it's an empty field). All in all, 4Media MP4 to MP3 Converter does a very good job at encoding audio and video files. But it needs to fix its problems. Even so, it is simple to use, even by beginners. The MinGW toolchain is a development environment for the GNU compiler collection (GCC).
