A: After you get the object in the onItemClick method, then you can get the element's id by getting the position of the current item. For example: @Override public void onItemClick(AdapterView parent, View view, int position, long id) { // Do your stuff } If the item's id is not the same as the position, then try the following: @Override public void onItemClick(AdapterView parent, View view, int position, long id) { // Make a new instance of the row Row element = (Row) view; // Get the element's id String elementId = element.getId(); } Note: the above code is for Android 2.x and should not be used for Android 1.x.
