Invasive Dotnet Optimizer works with applications built on both 32-bit and 64-bit architectures, also facilitating the manner in which the.NET runtime version is selected. The utility is quick in performing the compilation into native code. When the optimization process starts, the utility prompts a GUI dialog box, in which the progress bar indicates the evolution of the process. If the optimization task is performed without issues, the dialog box indicates the success. Otherwise, if errors occur, the window extends to display an activity log and the components that failed to be analyzed.
