The most popular soft synth sounds ever. Removes the limit of 16 sounds. Every sound is fully scaleable, you can use any sound from 0 to 4 octaves. No presets are included. Pricing: \$199.00 US \$ Download: In other news, Dennis writes about an MSX0402 - a 40-pin IC. MSX0402 Back in 1989, I created the first MSX0402-based sound chip, which I called the MSX0402. It had 40 pins (a lot of them unused!). It allowed a total of 60 tones of sound for the three-voice chip. The MSX0402 was created for MSX, which had 16 pins available for these kinds of chips. The MSX0402 required about 500 mA to run and ran in MSX CPU 4 or 5 mode. It was my first big challenge with digital logic. It was very difficult to program. Since I was so impressed with the performance of the MSX0402, I made a second MSX0402 for the MSX2109, a MSX machine with 68 pins. I called this chip the MSX0402B, and it was very easy to program. My own MSX library consisted of about a thousand sounds. It was even used on the final version of the MSX2109 for its little drum sounds and sound effects. The MSX0402B was only sold for about 10 years, until MSX2109 owners started receiving the MSX0402 and MSX0402B for free with their systems. The MSX0402B was very easy to program: about 15 to 20 minutes. The MSX0402 was easy to program because it was made of only about 10 pads, not more than 50 pads. (I had a competition to create the best MSX0402, which I won. It was impossible to win because there were only about three of them.) The following images show how I used the MSX0402, the MSX0402B
